

TB Colorizer

Version: 2.3.0 | Documentation date: 2026-08-04

Overview

Changes the color and character of a voice quickly with two simple controls.

What this plug-in solves

Voice transformation often requires several processors for pitch, formant, spectral balance, and non-linear character. TB Colorizer packages coordinated changes into named color identities so dialogue, singing, streaming, and sound-design voices can be changed quickly and recalled consistently.

What you can expect

- Fast vocal character changes
- Repeatable higher, lower, brighter, darker, and stylized identities
- Continuous movement from original to full transformation
- Simple automation with minimal setup

How it works

TB Colorizer applies a prepared tonal identity to a voice or other expressive source. Each color emphasizes a different balance of weight, presence, brightness, and texture, allowing broad character changes without building a long chain of separate processors.

Choose the color that points in the right direction, then use Transform to decide how far the source moves toward that identity. Keep the original performance audible enough to preserve articulation and emotion; the most convincing setting is usually the one that supports the role of the sound rather than completely replacing it.

Quick start

- 1 Choose a Color while the voice plays.
- 2 Set Transform fully toward the selected color to hear its complete identity.
- 3 Back Transform down until diction and emotional intent remain appropriate.
- 4 Level-match downstream processing.

- 5 Automate Transform for transitions rather than stacking multiple duplicate instances.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Eight Color identities

Pink, Blue, Green, Yellow, Legacy, Red, Black, and White each select a complete transformation profile. They are creative color labels, not claims about identity, gender, or voice cloning.

Transform

Transform moves continuously from the original voice toward the selected profile. Lower values preserve diction and natural pitch cues; higher values reveal the full designed character.

Automation

Automate Color for discrete scene changes and Transform for smooth reveals. Avoid rapid Color switching unless a hard cut is intentional.

Responsible use

The processor reshapes timbre; it does not identify, clone, or authenticate a person. Use it as a production effect and label synthetic character work appropriately.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Color	Chooses one of eight voice colors, from soft tonal shifts to more obvious character changes. Sweep broadly to find the useful tonal area, then make the focus narrower and the change smaller while listening in the full mix.
Transform	Sets how far the voice moves toward the selected color. Lower values stay closer to the original voice. Raise it until the contribution is obvious, then reduce it slightly and recheck the sound in the complete mix.

Practical uses

Dialogue character

- Choose a contrasting Color.
- Set Transform between moderate and strong.
- Add corrective EQ after Colorizer only if the scene requires it.

Expected result: A repeatable fictional voice character is created quickly.

Subtle vocal size change

- Choose Pink or Blue as a starting point.
- Use a low Transform value.
- Compare in the full mix rather than solo.

Expected result: Perceived size changes without turning the performance into an obvious special effect.

Common pitfalls

Extreme transformation can emphasize sibilance or room noise. Enable only the repair section that matches the problem and use the smallest amount that makes the noise less distracting without removing useful detail.

Monophonic, clean source material generally produces the clearest result. Reduce width or movement and check the result in mono as well as stereo. Preserve the original spatial cues when they are important to the recording.

The effect is not voice cloning. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.
