

TB Jewel Digger & Finder

Version: 1.3.0 | Documentation date: 2026-08-04

Overview

Turns incoming notes into tuned resonance and sparkling crystal-like motion.

What this plug-in solves

Broad shimmer reverbs often brighten everything and can obscure the harmonic center. TB Jewel Digger & Finder selects musically related bands above a base note, emphasizes or removes them, and sends that chosen material into a controllable crystal layer.

What you can expect

- Harmonic emphasis or subtractive comb motion
- Scale-aligned resonance patterns
- Tempo-synced or free filter animation
- Pitch-shifted, delayed, reversed crystal grains

How it works

TB Jewel Digger And Finder listens for musical information in the source and excites tuned resonances around it. The result can move from a subtle pitched halo to sparkling, crystal-like events that feel connected to the input rather than pasted on top of it.

Base Note and Scale establish the musical frame. Find and Dig decide how the source is detected and revealed, while the density, resonance, and motion controls shape the stream of events. The crystal section adds its own bright layer, which can be blended with the resonant body or heard by itself for more abstract sound design.

Quick start

- 1 Set Base Note and Scale.
- 2 Choose Find or Dig.
- 3 Set Shovel, Density, Q, and Amount.
- 4 Select Motion and tune Depth/Rate or enable Sync.
- 5 Raise Crystal Send and Crystal Mix.

- 6 Set Pitch and grain envelope controls.
- 7 Use Crystal Only if only the granular return is required, then finish with Mix and Output.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Base Note and Scale

Base Note selects C0-C8 and Scale limits target pitch classes. Set them to the song center or deliberately choose a contrasting map.

Find and Dig

Find emphasizes selected bands; Dig subtracts them to create moving notches and comb textures. Base Low Cut determines whether the area below the base note is protected or filtered.

Shovel, Density, Q, Amount

Shovel chooses the weighting/detune character. Density controls target count, Q controls width, and Amount sets filter intensity.

Motion system

Still, arpeggios, ramps, sine, square, triangle, musical random, and chaos move the targets. Depth controls travel; Rate can run freely or Sync to host divisions.

Crystal engine

Crystal Send feeds selected material to grains. Pitch, Grain Size, Attack, Decay, Delay, Feedback, Spread, Damp, Random, and Reverse Chance define the layer.

Crystal Mix and Crystal Only

Crystal Mix controls the crystal return level. Crystal Only removes the normal filtered wet path, while the global Mix can still preserve dry signal.

Output workflow

Use Mix for dry/final-wet balance and Output for final trim. Programs range from harmonic lanterns to cathedral shimmer and octave rain.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Amount	Sets how strongly the named effect changes the sound. Raise it until the contribution is obvious, then reduce it slightly and recheck the sound in the complete mix.
Base Low Cut	Removes low frequencies before they enter the main resonant section. Sweep broadly to find the useful tonal area, then make the focus narrower and the change smaller while listening in the full mix.
Base Note	Sets the root note used to build the resonant pattern. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Crystal Damp	Darkens the crystal particles and softens their high-frequency tail. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Crystal Mix	Sets the level of the crystal particle layer. Turn the processed sound up temporarily to learn its character, then return to the mix and keep only the amount that supports the source.
Crystal Only	Lets you hear only the crystal layer. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Crystal Send	Sets how much sound is sent into the crystal particle section. Raise it until the contribution is obvious, then reduce it slightly and recheck the sound in the complete mix.
Crystal Spread	Spreads the crystal particles across the stereo field. Check the result on speakers, headphones, and in mono when possible. Extreme spatial settings can feel exciting but may not translate everywhere.

Control	What it does and when to use it
Density	Sets how many events or layers overlap at once. Start with a small amount, then increase it until the motion is clear without hiding the timing or identity of the original sound.
Division	Chooses the tempo division used when Rate Sync is on. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Filter	Chooses Find for highlighting resonances or Dig for carving around them. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Grain Attack	Sets how quickly this part reacts when a sound begins. Judge this control while the source repeats in the full arrangement. The right timing should support the groove without making the sound feel detached.
Grain Decay	Sets how long this part takes to fade or return. Set it in relation to the rhythm and the space between events. Listen for pumping, gaps, or a tail that covers the next sound.
Grain Delay	Sets how long the crystal particles wait before they are heard. Start with a small amount, then increase it until the motion is clear without hiding the timing or identity of the original sound.
Grain Feedback	Returns processed sound into the effect to extend or intensify it. Increase it slowly and watch the output level. If the sound keeps growing after the input stops, reduce this control before adding more processing.
Grain Size	Sets the amount of particle detail or random variation. Start with a small amount, then increase it until the motion is clear without hiding the timing or identity of the original sound.
Mix	Blends the original sound with the processed sound. Turn the processed sound up temporarily to learn its character, then return to the mix and keep only the amount that supports the source.
Motion	Chooses how the resonant notes move over time. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.

Control	What it does and when to use it
Motion Depth	Sets how far the resonant pattern moves through the selected scale. Set the speed first and then add only enough movement to hear the pattern without pulling attention away from the performance.
Output	Sets the final listening level after processing. Match the final loudness before deciding whether the processing sounds better. Extra level can make almost any setting seem more impressive.
Pitch	Moves the pitch of the processed sound up or down. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.
Program	Loads a factory starting point. Adjust the controls afterward to fit the current sound. Use a preset as a direction, not a finished answer. Change one section at a time so it is clear which adjustment improves the source.
Q	Sets how wide or narrow the selected frequency focus is. Sweep broadly to find the useful tonal area, then make the focus narrower and the change smaller while listening in the full mix.
Random	Adds variation to the resonant movement and particle pattern. Start with a small amount, then increase it until the motion is clear without hiding the timing or identity of the original sound.
Rate	Sets how quickly the movement repeats. Set the speed first and then add only enough movement to hear the pattern without pulling attention away from the performance.
Rate Sync	Locks Motion speed to the song tempo. Set the speed first and then add only enough movement to hear the pattern without pulling attention away from the performance.
Reverse Chance	Sets whether or how often processed fragments play backward. Start with a small amount, then increase it until the motion is clear without hiding the timing or identity of the original sound.
Scale	Chooses the set of notes used by the moving resonances. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.

Control	What it does and when to use it
Shovel	Chooses the material-like character of the resonant layer. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.

Practical uses

Harmonic shimmer

- Choose Find.
- Match Base Note and Scale to the song.
- Use moderate Density and Q.
- Set Crystal Pitch to +12 semitones and raise Crystal Mix gradually.

Expected result: A luminous octave layer grows from harmonically selected content.

Moving spectral carve

- Choose Dig.
- Select an arpeggio or ramp Motion.
- Raise Amount and Q.
- Keep Crystal Mix low or off.

Expected result: The source develops animated scale-related notches without a large reverb tail.

Common pitfalls

Wrong key or scale choices can create intentional but dissonant resonances. Feed the plug-in one clear note at a time, confirm the musical key or target, and reduce correction or variation if the result becomes unstable.

High feedback and dense grains can accumulate level. Reduce the main amount, feedback, drive, or input first, then rebuild the sound while watching the output meter and listening after the source stops.

Tempo sync requires valid host tempo information. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.
