

TB Recorder

Version: 1.0.0 | Documentation date: 2026-08-04

Overview

Records the sound at the plug-in insert point directly into the file format you choose.

What this plug-in solves

A DAW bounce records a project output, not necessarily the exact signal at a particular insert. TB Recorder captures what reaches its plug-in position or standalone input while audio continues to pass through, making it useful for rehearsals, long sessions, processed stems, sound-design passes, and fast ideas.

What you can expect

- Exact insert-point recording
- Pause/resume without closing the temporary capture
- WAV, FLAC, AIFF, MP3, AAC, and Ogg delivery
- Automatic 1/5/10/30-minute or custom splitting

How it works

TB Recorder captures the audio that reaches its exact insert position while allowing the same signal to continue through the track. This makes the plug-in useful when the desired recording point is inside a processing chain rather than at the final project output.

Recording is protected in a temporary lossless capture and finalized when Stop is pressed. Format conversion and time-based splitting happen afterward. Choose the destination and file plan before a long pass, make a short test recording, and wait for finalization before closing the project or removing the plug-in.

Quick start

- 1 Choose the destination folder and base file name.
- 2 Select Output Format.
- 3 Set Split Length and Custom Minutes if needed.

- 4** Verify input meters and available disk space.
- 5** Press Record and confirm the recording state.
- 6** Use Pause/Resume when material should be excluded.
- 7** Press Stop and wait for finalization before closing the project.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Destination and file name

Choose a writable destination and clear file name before recording. The plug-in protects the live capture through a temporary file before final conversion.

Record, Pause, Resume, Stop

Record begins capture. Pause stops writing while passthrough and metering continue. Resume continues the same session. Stop finalizes and starts any required conversion/splitting.

Output Format

Choose WAV 32-bit float, FLAC 24-bit, AIFF 24-bit, MP3 320 kbps, AAC-LC 192 kbps, or Ogg Vorbis 320 kbps.

Split Length

Choose a preset split length, Unlimited, or Custom. Custom Minutes is used only when Custom is selected.

Pause-time behavior

Paused time is excluded from final duration and split calculation, preventing silent gaps from consuming segment length.

Passthrough and bypass

Recording does not intentionally change the signal that continues through the insert. Bypass behavior is host-dependent; avoid bypassing or removing the plug-in during an active capture.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Custom Minutes	Sets the file length used when Split Length is set to Custom. Make a short test capture and play the file back before starting a long recording. Confirm the destination, format, and available storage.
Output Format	Chooses the audio file type and quality used when recording is finished. Compare the available characters on the same short passage. Choose by the musical result rather than by the name of the mode.
Split Length	Chooses how often a long recording is divided into separate files. Set it in relation to the rhythm and the space between events. Listen for pumping, gaps, or a tail that covers the next sound.

Practical uses

Long rehearsal

- Choose FLAC 24-bit or WAV 32-bit float.
- Set 30-minute or custom splitting.
- Start before the session and monitor disk space.
- Use Pause for long breaks.

Expected result: The rehearsal is preserved in manageable sequential files without recording break silence.

Processed stem capture

- Place TB Recorder after the final insert to capture the processed signal.
- Choose WAV 32-bit float.
- Record the pass and stop only after tails finish.

Expected result: The exact insert output, including effects and tails, is captured for reuse.

Common pitfalls

Do not quit the host or remove the plug-in before Stop/finalization completes. Make a short test file, confirm the destination and free space, and wait for Stop or finalization to finish before closing the project.

Lossy formats are unsuitable as the only archival master. Make a short test file, confirm the destination and free space, and wait for Stop or finalization to finish before closing the project.

Confirm destination permissions and free disk space before long recordings. Make a short test file, confirm the destination and free space, and wait for Stop or finalization to finish before closing the project.
