

TB Colorizer

DETAILED ENGLISH USER MANUAL

A two-control voice color processor with eight repeatable tonal identities and a continuous transformation amount.

Catalog version: 2.3.0

Documentation edition: 2026-08-04

Host-visible endpoints documented: 3

1. Product purpose

A two-control voice color processor with eight repeatable tonal identities and a continuous transformation amount.

Voice transformation often requires several processors for pitch, formant, spectral balance, and non-linear character. TB Colorizer packages coordinated changes into named color identities so dialogue, singing, streaming, and sound-design voices can be changed quickly and recalled consistently.

What result it creates

- Fast vocal character changes
- Repeatable higher, lower, brighter, darker, and stylized identities
- Continuous movement from original to full transformation
- Simple automation with minimal setup

Signal flow

Input -> selected Color transformation profile -> Transform interpolation -> output

2. Complete feature guide

Eight Color identities

Pink, Blue, Green, Yellow, Legacy, Red, Black, and White each select a complete transformation profile. They are creative color labels, not claims about identity, gender, or voice cloning.

Transform

Transform moves continuously from the original voice toward the selected profile. Lower values preserve diction and natural pitch cues; higher values reveal the full designed character.

Automation

Automate Color for discrete scene changes and Transform for smooth reveals. Avoid rapid Color switching unless a hard cut is intentional.

Responsible use

The processor reshapes timbre; it does not identify, clone, or authenticate a person. Use it as a production effect and label synthetic character work appropriately.

3. Quick start

1. Choose a Color while the voice plays.
2. Set Transform to 100 percent to hear the full identity.
3. Back Transform down until diction and emotional intent remain appropriate.
4. Level-match downstream processing.
5. Automate Transform for transitions rather than stacking multiple duplicate instances.

4. Practical workflows

Dialogue character

1. Choose a contrasting Color.
2. Set Transform between moderate and strong.
3. Add corrective EQ after Colorizer only if the scene requires it.

Expected result: A repeatable fictional voice character is created quickly.

Subtle vocal size change

1. Choose Pink or Blue as a starting point.
2. Use a low Transform value.
3. Compare in the full mix rather than solo.

Expected result: Perceived size changes without turning the performance into an obvious special effect.

5. Automation, gain staging, and session use

- Automate only controls that serve a clear musical transition. Fast movement of frequency, time, pitch, mode, oversampling, or algorithm selectors may intentionally create artifacts or require a host-safe transition.
- Match perceived loudness before judging quality. A louder setting will often appear better even when the processing decision is not better.
- Use the plug-in bypass endpoint for comparison and preserve an unprocessed source or earlier project version.
- Factory programs are starting points. Loading a program changes multiple parameters; save a new DAW preset after adapting it to the source.
- The parameter appendix is captured from the installed VST3 host contract. It lists every host-visible endpoint, its displayed range/options, default, automation status, and identifier.

6. Limits, cautions, and troubleshooting

- Extreme transformation can emphasize sibilance or room noise.
- Monophonic, clean source material generally produces the clearest result.
- The effect is not voice cloning.
- No audible change: confirm the plug-in and relevant sub-block are enabled, Mix/Amount is not at a neutral value, and the source contains energy in the processed region.
- Unexpected level: return input, output, send, feedback, and parallel-mix controls to conservative values, then rebuild the setting one block at a time.
- Automation does not match the panel: reload the project, confirm the DAW is addressing the current plug-in version, and check whether a factory program or state recall replaced values.
- Clicks or transitions: avoid sample-instant changes to algorithm, time, pitch, mode, or oversampling selectors unless the sound is intentional.

7. Complete host parameter reference

This appendix contains all 3 parameters exposed by the current installed VST3 to a host. Repeated EQ-band endpoints are intentionally listed rather than collapsed. Discrete options are printed in full when the host contract exposes them.

Parameter	Range / options	Default	Host status	Function
Bypass VST3 ID 1652125811	Off, On	Off	Automatable; Bypass	Turns the complete plug-in processing path off or on through the host-visible bypass endpoint.
Color VST3 ID 94842723	Pink, Blue, Green, Yellow, Legacy, Red, Black, White	Pink	Automatable	Selects the operating algorithm, response shape, or tonal character for the named block.
Transform VST3 ID 1052666732	0% to 100%	100%	Automatable	Sets how strongly the named process affects the signal.

Documentation basis

Prepared from the current public catalog, current local product brief and implementation notes where available, existing English manuals where available, and a direct scan of the installed VST3 host contract. Internal implementation details that are not user-facing are intentionally excluded; all user-facing features and host-visible controls are documented.
