

TB Inverted Flanger

Version: 1.3.0 | Documentation date: 2026-08-04

Overview

Creates hollow movement, metallic sweeps, and focused science-fiction textures.

What this plug-in solves

Traditional flanging adds a modulated delay copy to the dry signal. TB Inverted Flanger reverses the phase relationship of the delayed voices, creating deeper cancellation and a more empty, subtractive character while retaining the recognizable sweep of a flanger.

What you can expect

- Hollow phase-cancelled movement
- Metallic jet and comb sweeps
- Subtle animated width at low mix
- Repeatable pedal-style modulation with six programs

How it works

TB Inverted Flanger mixes the source with a very short, moving delayed copy whose relationship is deliberately inverted. As the delay moves, different frequencies cancel and reinforce, creating hollow sweeps, metallic edges, and a focused science-fiction character.

Rate controls the speed of the sweep, Depth controls how far it travels, and Feedback makes the moving notches more pronounced. Color changes the tonal emphasis and Mix determines how much dry definition remains. Set Rate before Depth, then introduce Feedback carefully because it can make the effect much sharper.

Quick start

- 1 Start from Empty Orbit.
- 2 Set Mix high enough to hear the effect clearly.
- 3 Match Rate to the phrase or tempo.
- 4 Increase Depth for a wider sweep.
- 5 Raise Feedback carefully for resonance.

- 6 Use Color to decide how hollow the center should become.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Depth

Sets how far delay time moves. More depth increases sweep width and makes the flanger identity more obvious.

Rate

Controls LFO speed from very slow motion to a 10 Hz scanner-like modulation.

Feedback

Returns the inverted delayed signal to the delay path, increasing comb resonance and metallic intensity.

Color

Controls extra dry body inside the effect core. Higher Color emphasizes the hollow inverted-delay character by reducing that body.

Mix

Blends the original signal with the complete flanger core. Use low values for motion around an intact source and high values for exposed cancellation.

Programs

Empty Orbit, Null Corridor, Neon Comb, Signal Rift, Slow Eclipse, and 10Hz Scanner demonstrate the full movement range.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Color	Changes the overall brightness and tonal character. Sweep broadly to find the useful tonal area, then make the focus narrower and the change smaller while listening in the full mix.
Depth	Sets how far the movement travels. Set the speed first and then add only enough movement to hear the pattern without pulling attention away from the performance.
Feedback	Returns the processed sound into the effect to create a longer or stronger result. Increase it slowly and watch the output level. If the sound keeps growing after the input stops, reduce this control before adding more processing.
Mix	Blends the original sound with the processed sound. Turn the processed sound up temporarily to learn its character, then return to the mix and keep only the amount that supports the source.
Program	Loads a factory starting point. Adjust the controls afterward to fit the current sound. Use a preset as a direction, not a finished answer. Change one section at a time so it is clear which adjustment improves the source.
Rate	Sets how quickly the movement repeats. Set the speed first and then add only enough movement to hear the pattern without pulling attention away from the performance.

Practical uses

Sci-fi vocal

- Use medium Rate and high Color.
- Increase Feedback until metallic formants appear.
- Blend Mix below full wet to preserve intelligibility.

Expected result: The voice gains moving hollow sidebands while words remain recognizable.

Slow synth orbit

- Choose a very low Rate.
- Use high Depth and moderate Feedback.
- Automate Mix into transitions.

Expected result: Sustained harmonics move through wide subtractive notches.

Common pitfalls

Cancellation depends on the source and can reduce low frequencies unexpectedly. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.

High Feedback can become sharp and loud. Reduce the main amount, feedback, drive, or input first, then rebuild the sound while watching the output meter and listening after the source stops.

Saved older instances may recall older defaults; use a new instance when comparing factory behavior. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.
