

TB Resonator

Version: 1.0.0 | Documentation date: 2026-08-04

Overview

Makes incoming sound ring like a tuned body, creating instrument-like tone and sustain.

What this plug-in solves

EQ can emphasize existing frequencies but cannot create the sustained behavior of a resonant object. Reverb creates space but not a defined musical body. TB Resonator excites eight stable modes so drums, noise, guitars, vocals, and effects can ring like strings, wood, metal, chambers, or tuned percussion.

What you can expect

- Tuned resonance from C1 to C7
- Continuous body movement from soft to string to metal
- Strike-to-drive excitation behavior
- Memory from short body to 30-second tail

How it works

TB Resonator treats the input as an excitation for a tuned virtual body. Short hits make that body ring, while sustained sounds keep feeding it, turning noise, percussion, or speech into pitched material that can behave like a new instrument.

Tune sets the musical center, Body changes the resonant character, Touch controls how the input excites it, and Memory determines how long the response remains active. Mix places the resonant instrument behind or in front of the original. Set the tuning first, then balance touch and memory for the desired playability.

Quick start

- 1 Set Tune to the song or desired object pitch.
- 2 Choose Body by listening to interval structure.
- 3 Set Touch for struck or sustained source behavior.

- 4 Set Memory for the required decay.
- 5 Raise Mix until the resonant body sits correctly.
- 6 Leave headroom for overlapping modes.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Tune

Sets the resonant center from C1/32.7 Hz to C7/2093 Hz.

Body

Moves continuously through soft, string-like, and metallic modal relationships. It changes harmonicity and material impression.

Touch

Moves from strike-oriented excitation toward sustained drive. Low settings favor transients; high settings allow continuous energy to keep the body active.

Memory

Controls how long the resonant body continues. Long settings can sustain across phrases and consume headroom.

Mix

Blends the resonant body with the source. At high Mix, the plug-in behaves more like an instrument excited by the input.

Programs

Programs cover chambers, strings, tuned drums, sympathetic guitar, vocal glass, bass wood, chimes, blooms, and driven drones.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Body	Moves the resonant material from soft and wooden toward bright and metallic. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Memory	Sets how long the resonant body keeps ringing after the input fades. Set it in relation to the rhythm and the space between events. Listen for pumping, gaps, or a tail that covers the next sound.
Mix	Blends the original sound with the processed sound. Turn the processed sound up temporarily to learn its character, then return to the mix and keep only the amount that supports the source.
Program	Loads a factory starting point. Adjust the controls afterward to fit the current sound. Use a preset as a direction, not a finished answer. Change one section at a time so it is clear which adjustment improves the source.
Touch	Changes how the body is excited, from a short strike to a continuously driven tone. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Tune	Chooses the note or resonant pitch used by the effect. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.

Practical uses

Tuned drum

- Use a low or mid Tune.
- Set Touch toward Strike.
- Use short-to-medium Memory.
- Choose a less metallic Body and moderate Mix.

Expected result: The drum gains a clear, controlled musical body.

Ambient drone

- Use a stable Tune.
- Set Touch toward Drive.
- Use long Memory and a metallic or string Body.
- Automate Mix slowly.

Expected result: Sustained source energy excites a long evolving resonant instrument.

Common pitfalls

Long Memory allows tails after transport stops. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.

Resonant notes can conflict with the song key. Feed the plug-in one clear note at a time, confirm the musical key or target, and reduce correction or variation if the result becomes unstable.

High Mix and overlapping excitation can build peaks quickly. Reduce the main amount, feedback, drive, or input first, then rebuild the sound while watching the output meter and listening after the source stops.
