

TB SubLow

Version: 1.2.0 | Documentation date: 2026-08-04

Overview

Adds focused sub-bass at a chosen frequency to strengthen low-end weight and impact.

What this plug-in solves

An octave-down processor follows source pitch, and a static sine generator does not follow musical envelopes. TB SubLow creates new bass at a selected target frequency while using the source's body and onset behavior to control when and how that bass appears.

What you can expect

- Stable sub-bass at a chosen frequency
- Focused periodic core plus resonant/diffuse bloom
- Transient reinforcement
- Source-following body and release

How it works

TB SubLow creates controlled energy beneath the source around a chosen low note or frequency. Instead of boosting only what is already present, it builds a supporting sub layer that can add weight to drums, bass, impacts, and designed effects.

Target establishes where the low layer sits. Core supplies the stable foundation, Bloom extends the body, and Punch emphasizes the initial impact. Response decides how closely the generated layer follows the source. Set the target while monitoring on reliable low-frequency playback, then balance weight against headroom.

Quick start

- 1 Set Target for the playback system and arrangement.
- 2 Raise Core until the sub is audible.
- 3 Add Punch to connect it to the source onset.
- 4 Add Bloom for size and harmonics.

- 5 Tune Response so the bass follows without fluttering.
- 6 Set Output and check on small speakers and a sub-capable system.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Target

Sets the frequency of the generated bass independently of the detected input pitch.

Core

Controls the focused periodic center of the generated low end. It provides the most stable, tonal component.

Bloom

Adds resonant body, short diffusion, subtle harmonics, and air around the low-frequency core.

Punch

Reinforces onset energy so the generated sub speaks with the source transient rather than only sustaining underneath it.

Response

Controls how strongly and how quickly the generated body follows extracted source movement. Lower values are steadier; higher values track the performance more actively.

Output and Programs

Output trims the generated result. Programs cover deep foundation, mix floor, bass/pad/cinematic bloom, kick anchor, and upper-bass pulse.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Bloom	Adds a slower, swelling layer around the generated low tone. Raise it until the contribution is obvious, then reduce it slightly and recheck the sound in the complete mix.
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Core	Sets the steady center and weight of the generated low tone. Raise it until the contribution is obvious, then reduce it slightly and recheck the sound in the complete mix.
Output	Sets the final listening level after processing. Match the final loudness before deciding whether the processing sounds better. Extra level can make almost any setting seem more impressive.
Program	Loads a factory starting point. Adjust the controls afterward to fit the current sound. Use a preset as a direction, not a finished answer. Change one section at a time so it is clear which adjustment improves the source.
Punch	Emphasizes the beginning of the generated low tone for stronger impact. Raise it until the contribution is obvious, then reduce it slightly and recheck the sound in the complete mix.
Response	Sets how quickly the added sub-bass follows changes in the original sound. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Target	Chooses the main frequency of the added sub-bass. Sweep broadly to find the useful tonal area, then make the focus narrower and the change smaller while listening in the full mix.

Practical uses

Kick anchor

- Set Target near the desired low fundamental.
- Use moderate Core and Punch.
- Keep Bloom conservative.
- Use a responsive envelope that follows individual kicks.

Expected result: Each kick gains stable low-frequency weight without conventional EQ boost.

Cinematic foundation

- Choose a low Target.
- Use more Bloom and a slower Response.
- Keep Punch low unless impacts need emphasis.

Expected result: A sustained, spacious low foundation grows beneath the source.

Common pitfalls

Frequencies below the playback system's capability may consume headroom without being heard. Reduce the main amount, feedback, drive, or input first, then rebuild the sound while watching the output meter and listening after the source stops.

Generated sub can conflict with kick and bass fundamentals. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.

Monitor with high-pass comparisons and reliable metering. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.
