

TB Tune

Version: 1.2.0 | Documentation date: 2026-08-04

Overview

Corrects a monophonic vocal or instrument to the selected key and scale in real time.

What this plug-in solves

Basic correction always chooses the nearest allowed note, which can make an ambiguous performance jump in the wrong melodic direction. TB Tune adds a direction-aware Auto Musical control that considers the previous stable note and melodic movement before committing to the next target.

What you can expect

- Key- and scale-constrained pitch correction
- More intentional resolution of ambiguous notes
- Independent perceived vocal size through formants
- Stable note decisions suitable for automation and recall

How it works

TB Tune detects the current note of a monophonic voice or instrument and moves it toward an allowed note in the selected key and scale. It works best when one clear pitch is present; chords, strong noise, or overlapping notes can give the detector more than one possible answer.

Key and Scale define the musical target, while the correction behavior decides how quickly and firmly the performance is guided. Formant controls help preserve or deliberately change vocal character. Start with the correct key, use moderate correction, and increase the strength only when the intended style calls for an obvious tuned effect.

Quick start

- 1 Use a dry monophonic vocal.
- 2 Select the song Key and Scale.
- 3 Start Auto Musical low and raise it where melodic direction needs help.

- 4 Listen for stable note boundaries rather than maximum correction.
- 5 Set Formant Shift only after pitch behavior is correct.
- 6 Automate key/scale changes at clear musical boundaries.

Interface and key sections

This is a direct capture of the current plug-in interface. Use the visible labels to locate the areas and controls explained below.

Key

Selects the tonic from C through B, including sharps.

Scale

Provides Major, Natural/Harmonic/Melodic Minor, pentatonic modes, church modes, Blues, Chromatic, Whole Tone, and two diminished scales.

Auto Musical

At lower settings the target choice is more neutral. Raising it gives more weight to the established melody and the previous stable note when the pitch is ambiguous.

Formant Shift

Moves perceived vocal size independently of the corrected note. Lower settings generally sound larger and darker; higher settings sound smaller and brighter.

Monophonic operation

The detector expects one dominant sung note. Harmonies, chords, loud bleed, or heavy reverb reduce target certainty.

Controllable properties

The guide uses the names shown on the plug-in panel. Each explanation describes the audible result, a useful way to approach the control, and an important interaction to listen for.

Control	What it does and when to use it
Auto Musical	Changes correction strength according to musical movement, keeping passing notes more natural at lower settings. Move it gradually and listen for the point where the intended result becomes clear without introducing a new problem elsewhere.
Bypass	Turns the complete effect off or on for a direct before-and-after comparison. Compare with bypass at a similar loudness. If the effect creates a tail, let that tail settle before judging the difference.
Formant Shift	Changes the apparent vocal or instrument size without moving the corrected note. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.
Key	Chooses the root note of the song. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.
Scale	Chooses which notes are allowed during pitch correction. Choose the musical direction first, then check attacks and sustained notes for unwanted wobble or a change in character.

Practical uses

Natural correction

- Choose the exact key and scale.
- Use moderate Auto Musical.
- Leave Formant at zero.
- Check sustained notes and phrase transitions.

Expected result: Pitch settles into the scale while the line retains intentional movement.

Designed hard character

- Use a restrictive scale.
- Raise Auto Musical as required.
- Add positive or negative Formant Shift for a stylized size change.

Expected result: The vocal becomes deliberately tuned and characterful.

Common pitfalls

Incorrect Key or Scale produces musically wrong targets even if tracking is accurate. Feed the plug-in one clear note at a time, confirm the musical key or target, and reduce correction or variation if the result becomes unstable.

Polyphonic sources are outside the intended use. Return the strongest control toward neutral, compare with bypass at a similar loudness, and add the processing back one section at a time.

Formant shifting cannot remove all artifacts from extreme source material. Enable only the repair section that matches the problem and use the smallest amount that makes the noise less distracting without removing useful detail.
